Anti MARCKS Monoclonal Antibody (Clone No. MAR11/2)

Myristoylated alanine-rich C kinase substrate (MARCKS), a specific substrate for protein kinase C, is abundant in the brain. MARCKS binds calmodulin under Ca^{2+} or actin under non-Ca^{2+} conditions. Phosphorylation of MARCKS (P-MARCKS) can be used as an indicator of protein kinase C activation in intact cells. It has been shown that P-MARCKS has relatively weaker binding activity to calmodulin and actin compared with MARCKS.

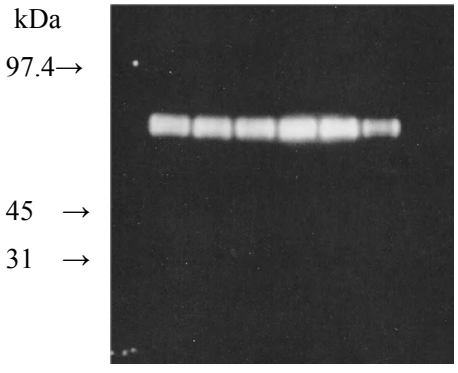
Pathophysiologically, P-MARCS is also detected in the brain of Alzheimer's disease patients and in the smooth muscle cells of arteriosclerosis.

This antibody is specific to MARCKS and could be used for western blotting and immunohistchemistry.

Package Size	50µg (200µL/vial)
Format	Rat monoclonal antibody 0.25 mg/mL
Buffer	Block Ace as a stabilizer, containing 0.1% Proclin as a bacteriostat
Storage	Store below –20℃ Once thawed, store at 4℃. Repeated freeze-thaw cycles should be avoided.
Clone No.	MAR11/2
Subclass	IgG2a
Purification method	The lymphocytes from rat, immunized with C terminal peptides of rat MARCKS, were fused to mouse myeloma SP2 cells. The cell line (MAR11/2) with positive reaction was grown in serum free medium from which the antibody was purified by Protein G affinity chromatography.

Working dilution for immunohistochemistry: about 1~ 5µg/mL

The reactivity of anti MARCKS antibody using western blotting.



Rane No.
1: C6 cell activated by beta-PMA 0 min
2: 15 min
3: 30 min
4: 45 min
5: 60 min
6: C6 cell no treatment (DMSO)
