

## Rad51 Protein (human )

10-001 20  $\mu$ g, 10-002 100  $\mu$ g

Human Rad51 protein is a functional and structural homolog of *E. coli* RecA protein, which plays a major role in genetic recombination and recombination repair by mediating strand exchange reaction between homologous DNA strands (1,3). Rad51 functionally and physically interacts with its paralogs Dmc1, Rad51B, Rad51C, Rad51D, Xrcc2 and Xrcc3, and also with Rad52 in recombination processes. It also interacts with oncogene proteins and tumor suppressors such as BRCA1, BRCA2, and P53 for the maintenance of genome stability (1, 2).

The product was highly purified from *E. coli* over-expressing human Rad51 protein as a recombinant protein (Fig. 1). Since the tag was removed from the recombinant protein (it still contains Gly-Ser-His at the N-terminal), it has been shown to retain nuclear filament forming and strand-exchange activity (3) as well as interaction with Rad52. This product was confirmed to possess single strand DNA stimulated ATPase activity.

### Application

- 1) Studies on homologous recombination in mammals including human
- 2) Studies on the interaction of Rad51 protein with various proteins
- 3) To be used as a standard for western blotting.

### Specification

Purity: > 95% as judged from SDS-PAGE analysis (Fig.1)

Form: 1 mg/ml in 20 mM Tris-HCl pH8.0

100 mM KCl, 1 mM DTT, 0.5 mM EDTA, 20% glycerol

Storage: -70C
